Project Name	Health360: Comprehensive Healthcare Risk & Disease Analytics
Maximum Marks	5 Marks

By using stories in Tableau, you can effectively communicate complex data in a way that is both interactive and engaging, making it easier for the audience to follow along and understand the insights. It's a tool for **data storytelling**, allowing you to present insights in a cohesive, engaging way that takes viewers through a logical progression of findings or analyses.

In Tableau, **Story** is a feature that allows you to create a sequence of dashboards, visualizations, and text to present data insights in a cohesive and narrative-driven way. It's like a slideshow within Tableau that guides the audience through a series of data points, helping them understand key insights, trends, or outcomes of your analysis.

Story Narrative – Health360 Executive Story (4 Scenes):

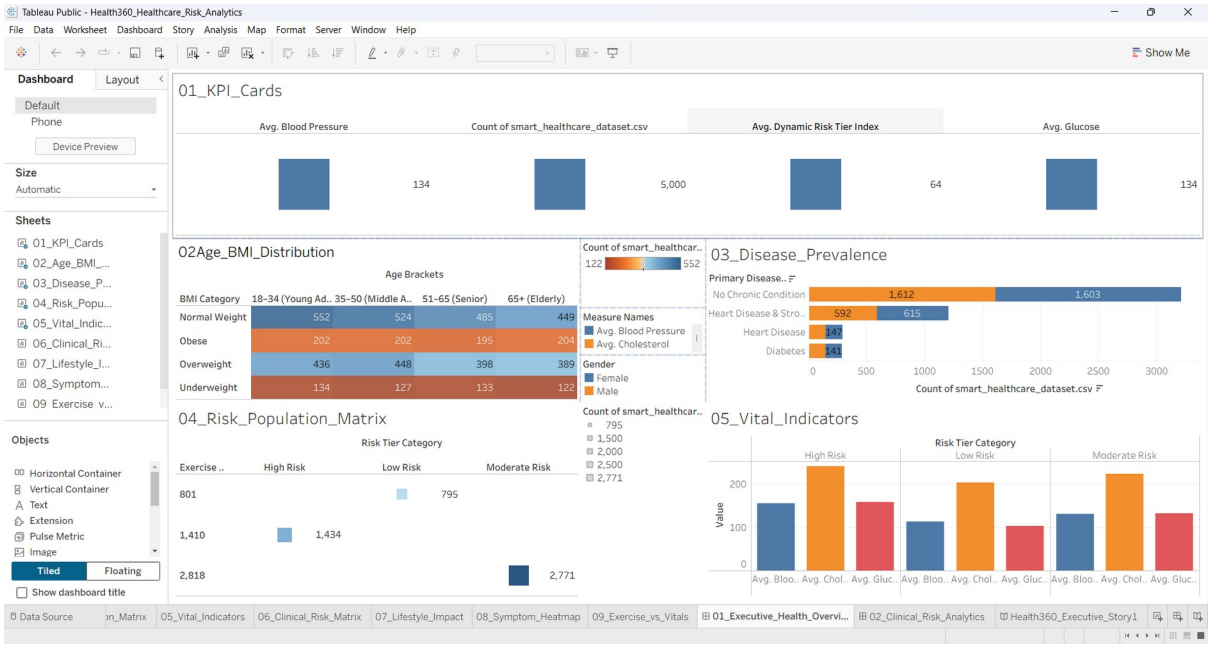

The Health360 story guides executives from population-level trends down to clinical resource allocation in four scenes. Each scene is a Tableau story point built from the dashboards shown in Figure 1.

Scene 1 – Macro Population Demographics & Age Stratification: Opens with the 5,000-patient cohort, comparing BMI categories across four age brackets (18–34, 35–50, 51–65, 65+) and the prevalence of chronic conditions (Story point 01: Population Overview & Condition Prevalence).

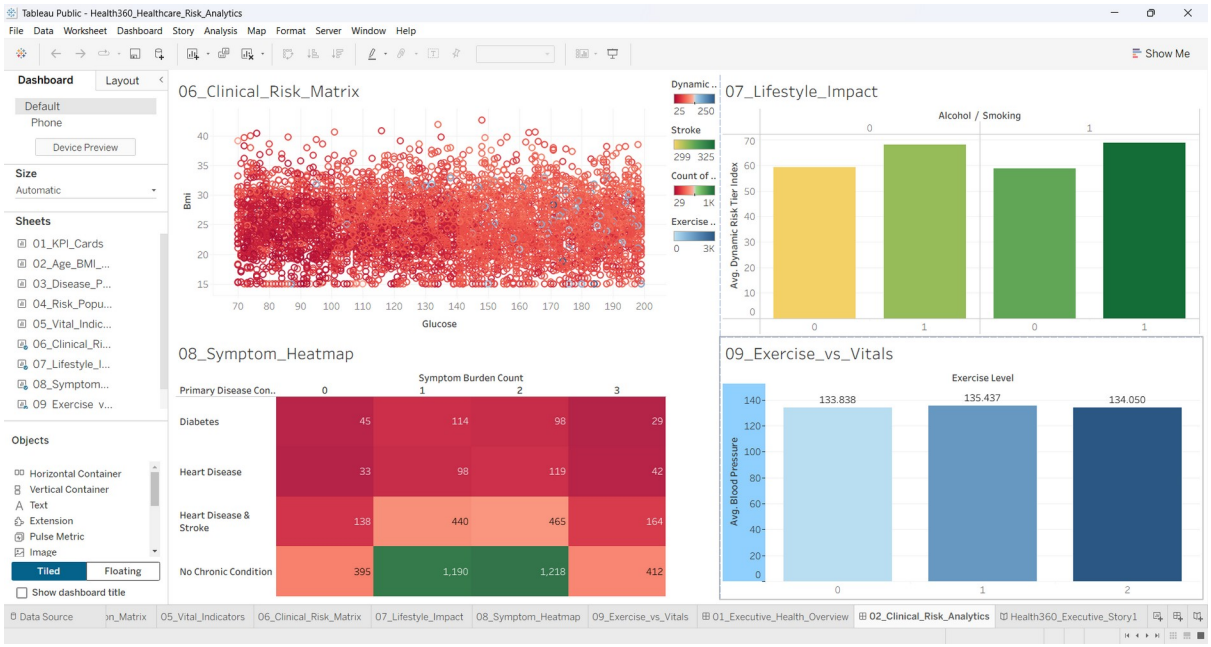

Scene 2 – Physiological Vitals Analysis: Breaks the cohort into Low, Moderate and High Risk tiers and compares average Blood Pressure, Cholesterol and Glucose in each, showing which vitals drive tier assignment (Story point 02: Risk Tiers & Vital Health Metrics).

Scene 3 – Lifestyle Habit Compounding Impacts: Plots BMI against Glucose and the Dynamic Risk Tier Index by smoking and alcohol status, with exercise level alongside, to show how habits add to clinical risk (Story point 03: Clinical Risk Factors & Lifestyle Drivers).

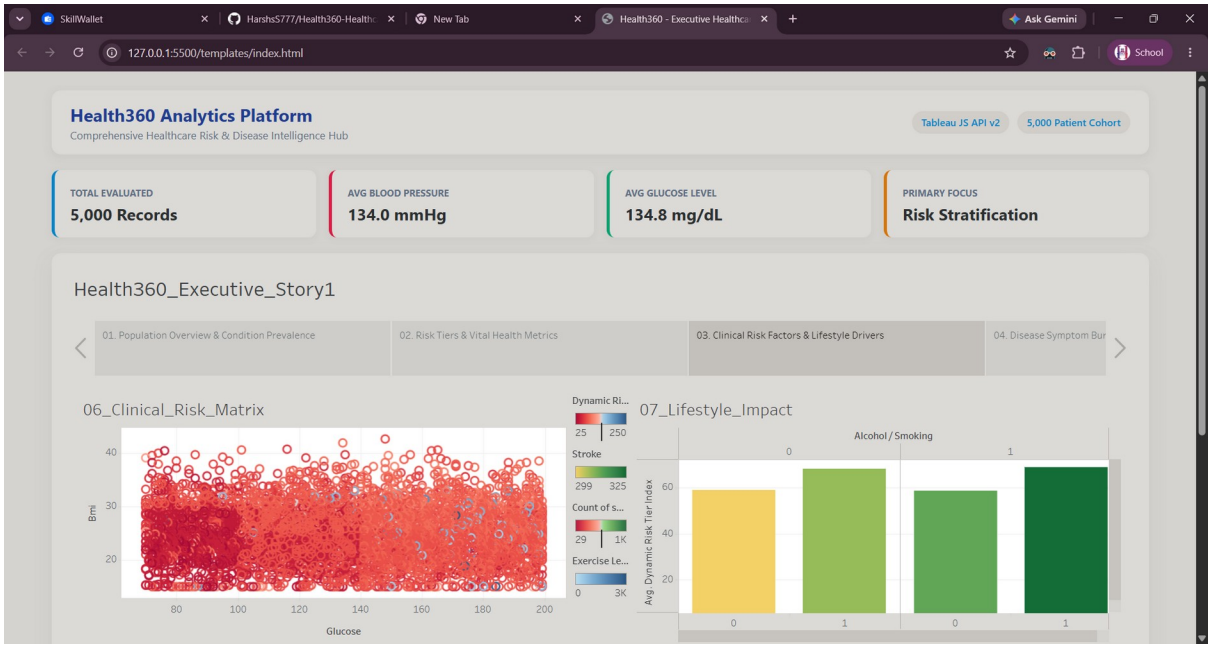

Scene 4 – Symptom Burden Co-occurrence & Hospital Resource Allocation: Closes with a heatmap of symptom burden (chest pain, fatigue, dizziness) by primary disease condition, pointing to the cohorts that need dedicated preventive care and triage capacity (Story point 04: Disease Symptom Burden Analysis).

Observations:

- **Weight-related risk is broad-based and largest in middle-aged cohorts**: Overweight and obese patients make up roughly 48–51% of every age bracket, and the 35–50 bracket holds the largest count (650 of 1,301 patients), so weight management is a population-wide priority rather than a single-age issue.
- **Physiological thresholds drive high-risk classification**: Of the 1,434 High Risk patients, 98.7% have Systolic BP above 140 mmHg or Glucose above 140 mg/dL (82% for BP, 76% for Glucose).

- **Smoking is the dominant lifestyle driver of risk**: Smokers fall into the High Risk tier about 2.2x as often as non-smokers (roughly 39% vs 18%). Alcohol adds little on its own, and exercise level shows no clear effect on tier assignment.
- **Multi-condition co-occurrence guides hospital triage**: 1,207 patients (about 24% of the cohort) have both heart disease and stroke, compared with only 292 who have heart disease alone, and most of them report 1–2 symptoms, marking a high-density cohort for dedicated preventive intervention.
- **Guided story flow accelerates executive decision-making**: The 4-scene narrative transitions stakeholders seamlessly from macro population trends down to localized clinical resource allocation.

Activity 2:

Publish Story on Tableau Public and Paste Public link below
